

Design and Optimization of Energy systems - Video course

COURSE OUTLINE

Introduction to system design - Regression analysis and curve fitting - modeling of thermal equipment (very brief) - system simulation (successive substitution - Newton - Raphson method) - examples - economic analysis - optimization - Lagrange multipliers, search methods, linear programming, geometric programming- New generation optimization techniques - simulated annealing, Genetic Algorithms, Bayesian statistics.

Examples applied to heat transfer problems and energy systems such as gas and steam power plants, refrigeration systems, heat pumps and so on.

COURSE DETAIL

Sl. No	Topic	Lectures
1.	Module 1: Introduction <ul style="list-style-type: none"> • Introduction to design and specifically system design. • Morphology of design with a flow chart. • Very brief discussion on market analysis, profit, time value of money, an example of discounted cash flow technique. • Concept of workable design, practical example on workable system and optimal design. 	3-4
2.	Module 2 : System Simulation <ul style="list-style-type: none"> • Classification. 	6-7

NP-TEL

NPTEL

<http://nptel.iitm.ac.in>

Mechanical Engineering

Pre-requisites:

- Thermodynamics.
- Fluid Mechanics.
- Heat Transfer.

Additional Reading:

1. There is an accompanying text book titled "**Essentials of Thermal System Design and Optimization**" authored by Prof. C. Balaji and Published by Ane Books, New Delhi in India and CRC Press in the rest of the world.

Coordinators:

Prof. C. Balaji
Department of Mechanical Engineering IIT Madras

	<ul style="list-style-type: none"> • Successive substitution method - examples. • Newton Raphson method - one unknown - examples. • Newton Raphson method - multiple unknowns - examples. • Gauss Seidel method - examples. • Rudiments of finite difference method for partial differential equations, with an example. 		
3.	<p>Module 3: Regression and Curve Fitting</p> <ul style="list-style-type: none"> • Need for regression in simulation and optimization. • Concept of best fit and exact fit. • Exact fit - Lagrange interpolation, Newton's divided difference - examples. • Least square regression - theory, examples from linear regression with one and more unknowns - examples. • Power law forms - examples. • Gauss Newton method for non-linear least squares regression - examples. 	8	
4.	<p>Module 4: Optimization</p> <ul style="list-style-type: none"> • Introduction. • Formulation of optimization problems – examples. • Calculus techniques – Lagrange multiplier method – proof, examples. • Search methods – Concept of interval of uncertainty, reduction ratio, reduction ratios of simple search techniques like exhaustive search, dichotomous search, Fibonacci search and Golden 	22	

section search – numerical examples.

- Method of steepest ascent/ steepest descent, conjugate gradient method – examples.
- Geometric programming – examples.
- Dynamic programming – examples.
- Linear programming – two variable problem –graphical solution.
- New generation optimization techniques – Genetic algorithm and simulated annealing - examples.
- Introduction to Bayesian framework for optimization- examples.

Design and Optimization of Energy Systems free online course video tutorial by IIT Madras. You can download the course for FREE! **Overview.** Module 1: Introduction Introduction to design and specifically system design. Morphology of design with a flow chart. Very brief discussion on market analysis, profit, time value of money, an example of discounted cash flow technique. Concept of workable design, practical example on workable system and optimal design. Module 2 : System Simulation Classification. Successive substitution method - examples. Newton Raphson method - one unknown - examples. Save Big on Premium Membership and Video Courses. Hello, hope all is well with you! It's our pleasure to share with you two Cyber Monday deals for our new electrical engineers, expiring on December 3rd: 20% on EEP | Read more. Nov 26, 2020 | Energy and Power. The most used types of single-phase motors in the world. Depending on background and expertise, projects can include systems such as energy transmission and distribution, protection and control etc. Browse // MS Excel Spreadsheets (XLS, XLSX). **Electrical Design Calculations For Industrial Plants.** In order to design the line there are few important elements to define: voltage drop, the load, sizing the cable, ampacity, and cable temperature. The load is based on the PREMIUM Membership Required. Discover energy systems integration and how to develop a sustainable energy system with this online course from the European Institute of Innovation and Technology. **What will you achieve?** By the end of the course, you'll be able to Explain the added value of energy systems integration. Identify where ESI is most valuable within the energy system. Describe energy systems integration with an example that includes more than one type of coupling. Evaluate the importance of a cost-benefit analysis for a given energy systems integration problem. Explore long-term benefits/drawbacks and short-term benefits/drawbacks of energy systems integration. Who is the course for? NPTEL Online Videos, Courses - IIT Video Lectures. Well Organized! Design and Optimization of Energy Systems. Design and Optimization of Energy Systems. Design and Optimization of Energy Systems by Prof. C. Balaji, Department of Mechanical Engineering, IIT Madras. For more details on NPTEL visit <http://nptel.iitm.ac.in>. Mod-01 Lec-01 Introduction to Optimization. Mod-01 Lec-02 System Design and Analysis. Mod-01 Lec-03 Workable system. Mod-01 Lec-04 System simulation.
